3 Third Section

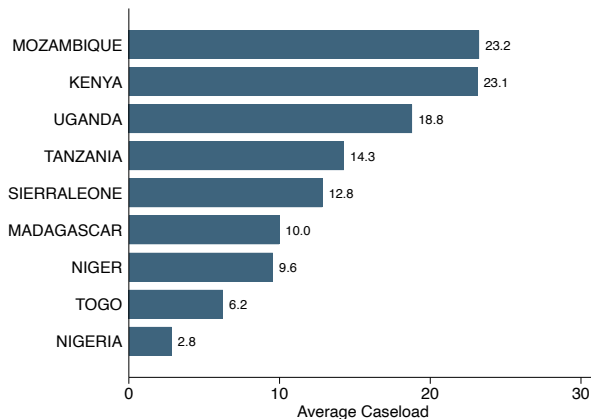

- Breakdown of Caseload by Percentiles

Measurement of Caseload

Caseload is defined as the number of outpatient visits per healthcare provider per day of each facility. It is calculated based on the number of outpatient visits within the last three months, the number of days per week that the facility is open, and the number of healthcare providers (including all types of providers that regularly offer outpatient consultations). The denominator is adjusted for the presence of providers to reflect the total number of healthcare providers available to provide care.

Overall Caseload

Figure: Average Caseload by Country

Caseload is the average across all facilities in the country
